

Q Would you face any deployment challenges? What are the challenges faced while you deploy model from app server to "production" server?

① In "production" server open source libraries are not supported. (organizations purchase the licensed software)

② Production server sometimes too old OS and application server new. The code running on app server slows down.

③ Production server has more security firewalls.

④ If we train very big data run time is very slow.

⑤ Too much mining data will again lead to "production" issues.

⑥ The business head sets up a timer of 2-3 seconds. If any session hit to the production database and the session does not complete within 2-3 seconds it would be terminated.
