

④ K-Nearest Neighbour

For example consider
consider $k=3$.
The 3 nearest
Neighbours of $\circ$
are $\triangle$ hence
 $\circ$ belongs to $\triangle$
as it has least
distance from $\triangle$.

For example $k=20$

$\triangle \rightarrow 3$

$* \rightarrow 11$

$\square \rightarrow 2$

In this case it will wrongly classify $\circ$ as $*$.

Hence we need to carefully choose the value of k such that it is not very small or very high.
