

⑧ Logistic Regression

Logistic Regression is one of the techniques used for classification.

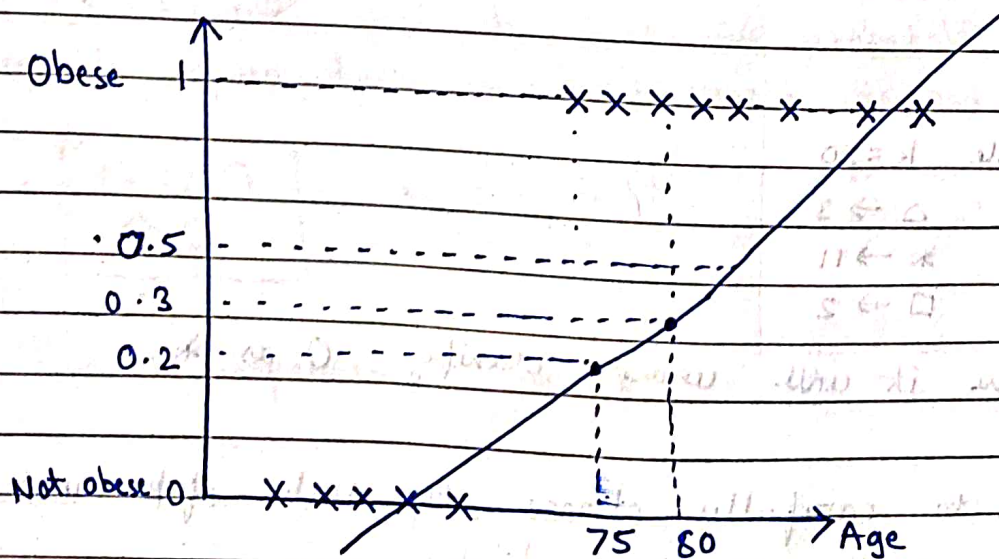

Q Why linear regression will not work for classification?

If value ≥ 0.5 obese $\Rightarrow$ consider equivalent to 1

If value < 0.5 not obese $\Rightarrow$ consider equivalent to 0

Now if we consider an outlier then the best fit line will change

Now after the best fit line changes we can say that the classification of 75 and 80 age is now not obese which is wrong.
